

# Polling Table Testing

The polling table module's logic and database communication is handled by the model class used within the MVC pattern. This is the only class tested in the polling table. The unit tests consist of PEX generated tests as well as 3 manually written tests. Contracts is used in the model class that provide a solid background for PEX to test against. The manually written tests rely heavily on the DAO module and it is crucial that the database is setup correctly, and the right credentials for the database is provided. The test along with GUI verification (not provided here) should convince us that the system functions as promised. Testing gives by no means a 100% certainty that the system has no defects but they (the tests) can strengthen our belief that it to a large extent fulfills the requirements.
